

GREEN MILKWEED

Asclepias viridis Walt.

plant symbol = ASVI2

Contributed By: USDA, NRCS, Nacogdoches (TX)
Technical Office and the National Plant Data Center

Alternate Names

green antelopehorn

Uses

Caution: Poisonous plant. Like many milkweeds, plant parts are thought to be poisonous to cattle, but are rarely consumed. Smith et al. (2000) documents sheep loss to this species. Monarch butterfly eggs are laid on plants in the *Asclepias* genus. The larvae consume the leaves and the toxins found in *Asclepias* are also in the larvae and mature butterflies. This provides protection from bird predators. The long silky hairs on the seed were once used in making candlewicks. Other than Monarch butterflies, the plant provides no known wildlife value.

Status

Please consult the PLANTS Web site and your State Department of Natural Resources for this plant's

current status (e.g. threatened or endangered species, state noxious status, and wetland indicator values).

Description

General: Milkweed Family (Asclepiadaceae). Green antelopehorn is a native, perennial forb or herb. Globally, there are 2,000 – 3,000 species in the milkweed (Asclepiadaceae) family. In Texas, there are five different genera in this family, with 35 species in the *Asclepias* genus. *Asclepias viridis* is the most common milkweed in Texas ranging from deep east Texas to the Edwards Plateau and typically has wider leaves than *Asclepias asperula*. They have alternate, entire leaves. The leaf margins are often wavy. Flowers are white and in an umbel, mostly one per plant. Upon close inspection, some rose or purple color is evident in the center of each individual flower (gynostegium). The milky substance that is exuded when a plant part is broken is very sticky, much resembling “Elmer’s glue.” These milkweeds bloom from late spring to middle summer.

Other milkweeds in Texas, such as *Asclepias oenotheroides*, *Asclepias incarnata*, *Asclepias viridiflora* have similar growth habits and flowers, but do not have alternate leaves.

Distribution

Known from Nebraska to Ohio and Texas to Florida. For current distribution, please consult the Plant Profile page for this species on the PLANTS Web site.

Establishment

Adaptation: In Texas, this species appears to prefer loamy, moist soils, but is found on virtually all soil types, except for deep sands and very wet soils. It is quite common on blackland clay. Because livestock avoids the plants, they tend to become more prevalent in some overgrazed pastures. These plants are quite common along roadsides.

Cultivars, Improved and Selected Materials (and area of origin)

Please check the Vendor Database, expected to be on-line through the PLANTS Web site in 2001 by clicking on Plant Materials. These plant materials are somewhat available from commercial sources.
