THREE-FLOWER MELIC

*Melica nitens* (Scribn.) Nutt. ex Piper

Plant Symbol = MENI

**Alternate Names**
threeflower melicgrass

**Uses**

*Restoration:* Three-flower melic (*Melica nitens*) can be a good, native, cool-season grass for restoration of riparian or wooded pastures in central Texas. It does not appear to be suited to south Texas conditions where it will survive, but does not thrive or produce seed.

**Status**

Please consult the PLANTS Web site and your State Department of Natural Resources for this plant’s current status (e.g. threatened or endangered species, state noxious status, and wetland indicator values).

**Description**

Three-flower melic is a native, cool-season, perennial bunchgrass. It can grow two to three feet in height.

Three-flower melic is a member of the Festucaee tribe of the grass family (Poaceae). Gould (1975) notes that the common name three-flower melic is inappropriate for most Texas accessions because the plants’ spikelets commonly have only two perfect florets.

**Adaptation**

Three-flower Melic is found from Pennsylvania to Iowa and Kansas, and south to Virginia, Arkansas, Oklahoma, and Texas. In Texas, it is most often found in the Edwards Plateau and the North Central regions, but can also be found west to the Trans-Pecos and East to the western portion of East Texas. It is usually found in open woods, on moist canyon slopes, in canyon bottoms, on rocky grasslands, as well as along stream banks and along roadsides. Three-flower melic tends to prefer partial shade, and calcareous or sandy loam soils.

**Known Distribution**

Please consult the distribution map on PLANTS for this species.

**Establishment**

Three-flower melic can be grown from seed. It has small, hard, shiny, dark brown seeds that are easy to work with. Germination testing at Kika de la Garza Plant Materials Center in the fall of 1998 yielded germination percentages ranging from 51% to 70% for different accessions. Sixteen hours of darkness at 15ºC and eight hours of light at 30ºC appeared to produce the best germination. No treatments were applied to seeds used for this study.

Seed should be planted at approximately a ¼ inch depth. A seeding rate of four pounds of pure live seed (PLS) per acre is recommended. In planting mixtures, reduce the rate according to the amount of three-flower melic in the mixture. There are approximately 235,700 melic seeds per pound.

Seedbed preparation should begin well in advance of planting. Establish a clean, weed-free seedbed by either tillage or herbicide. Prior to planting, the site should be firm and have accumulated soil moisture.

Planting should be scheduled for late summer or early fall. Planting is best done with a seed drill. Broadcast seeding may be used, but some type of additional soil coverage will be beneficial to ensure good seed to soil contact. Soil analysis should be
performed prior to planting to determine the necessary fertilizer applications.

Management
Although three-flower melic is a cool-season grass, it put on growth throughout the summer at a field site in South Central Texas. It may be better classified as a year-round forage grass for riparian-savannah pastures in the Texas Hill Country. A planting of three-flower melic in Bandera, Texas yielded up to 140 pounds of seed per acre.
