GIANT CUTGRASS
Zizaniopsis miliacea (Michx.) Doell & Aschers.
Plant Symbol = ZIMI

Contributed By: USDA NRCS National Plant Data Center

Alternate Names
southern wild grass, water millet

Uses
Cattle readily graze giant cutgrass from late winter through summer. If grazed in the dormant season, a mineral supplement should be provided. This grass is also used for erosion control around lakes and on stream banks. Geese and ducks forage on its green basal leaves.

Status
Please consult the PLANTS Web site and your State Department of Natural Resources for this plant’s current status, such as, state noxious status and wetland indicator values.

Description
Grass Family (Poaceae). Giant cutgrass is a warm-season, rhizomatous perennial grass. The height is between 3 to 9 feet. The leaf blade is long and flat, rough on edges, almost sawlike. The leaf sheath is rounded and opens with shorter than internodes. The seedhead is narrow and nodding panicles, spikelets unisexual, 1-flowered, male and female on same branch of panicle.

Management
For maximum production, no more than 50 percent of current growth by weight should be removed at any season. Controlled burning is recommended if enough dead leaves and stems accumulate on the ground to smother new growth. Burn only when there is at least 1 inch of water above soil surface. Defer grazing after burning to permit 8 inches of regrowth. Cattle walkways are essential to distribute grazing and provide access to forage on fresh marshes where this grass is important.

Establishment
Although a warm-season grass, giant cutgrass grows some in late fall along the gulf coast. It produces seed mostly in spring and early summer. It grows in dense bunches from large, creeping rhizomes. Mature plants turn yellowish after first frost, but usually have green basal leaves all year. It grows primarily on firm mineral clays or silt soils. Also, it grows in fresh-water marshes and swamps, on creek and riverbanks, and in drainage ditches and canals. It tolerates a small amount of salt in free soil water. It does best if the water level fluctuates from soil surface to 12 inches above.
