CHALKY BLUESTEM
*Andropogon capillipes* Nash

Contributed By: USDA NRCS National Plant Data Center

---

**Description**

Chalky bluestem is a warm-season, perennial bunch grass. The height is between 3 and 5 feet. The leaf blade is folded tightly; keeled at base but flattened toward tip; lower blade is 20 to 25 inches long and 1/2 inch wide. The leaf sheath is keeled, overlapping and crowded at base. The ligule has a membrane 1/16-inch long. The seedhead is raceme partly enclosed in purplish-brown spathe about 1 inch long.

**Management**

Since this grass seldom contributes more than 10 to 15 percent of total herbage on any site, it is seldom selected as a key management species. It maintains itself in the plant composition of grazable woodlands if grazing is deferred every summer and proper grazing is practiced during winter. Under good management, it is one of the first grasses to become established on a range that has been overgrazed. Annual burning reduces stand.

**Establishment**

Growth starts in mid-January in southern Florida and 30 to 45 days later in northern part of range. Vigorous plants produce leaves 8 to 10 inches long in 30 days. Stems, blades, and sheaths are covered with a white chalky coating that rubs off easily. Seedheads appear in September and early October. Seed ripen in October and November. Chalky bluestem is a good seed producer. Basal leaves stay green during winter unless temperature falls below 20° F. Particularly well adapted to wet acid or neutral sandy soils. Makes maximum growth on seepy slopes.
