Splitbeard bluestem

*Andropogon ternarius* Michx. var. *ternarius*

Plant Symbol = ANTE2

**Common Names:**
- Split-beard bluestem
- Split-beard beardgrass
- Split beard broomsedge
- Split bluestem
- Feather bluestem
- Silvery beardgrass
- Paintbrush bluestem

**Scientific Names:**
*Andropogon ternarius* Michx.
*Andropogon ternarius* Michx. var. *cabanisii* (Hack.) Fernald & Grisc.
(Thıs species is exclusive to Florida)

**Description**

*General:* Splitbeard bluestem is a native warm season, perennial bunchgrass. The plants usually begin growth in April and reach a mature height of 2 to 4 feet. Basal leaves are numerous, flat or rolled, 1/8 to ½ inch wide and 10 to 16 inches long. The leaves can be glaucous, glabrous, or loosely villous. The leaf sheaths are villous and often purplish in appearance. The stems are long, slender, and erect branching in the upper 2/3 of the plant. The inflorescence is composed of paired racemes about 2 inches long, containing many sessile spikelets (.19 to .27 inch) covered in silvery white hairs (Hitchcock, 1951; Leithead et al. 1971; Tyrl et al. 2008).

*Distribution:* Splitbeard bluestem is distributed from Delaware south to Florida and west to Kansas, Oklahoma and Texas. It is especially widespread in the eastern half of Texas. (Diggs et al. 2006). For current distribution, please consult the Plant Profile page for this species on the PLANTS Web site.

*Habitat:* Splitbeard bluestem is found on upland woodlands and woodland pastures and is commonly associated with little bluestem (*Schizachyrium scoparium*) on well drained sandy sites (Diggs et al. 2006 and Grelen and Hughes 1984).

**Adaptation**

Splitbeard bluestem is adapted to coarse and medium well drained sandy and sandy loam soils with lower fertility and a pH of 4.0 to 7.5. This plant is moderately shade tolerant, drought tolerant, and grows in areas with annual rainfall ranging from 20 to 60 inches (Ladybird Johnson Wildflower Center 2016 and USDA, NRCS 2016).

**Uses**

*Livestock:* Cattle will graze splitbeard bluestem in the spring shortly after growth begins. The forage value is similar to little bluestem which varied from 11.6% to 8.1% crude protein from April to June respectively on southern pine range (Leithead et al. 1971, Grelen and Hughes 1984, and Pearson et al. 1982).

*Wildlife:* The seeds are consumed by birds and small mammals. Native bees use splitbeard bluestem for nesting materials or utilize the plant itself as a nest structure (Ladybird Johnson Wildflower Center 2016).
Native Habitat Restoration: Splitbeard bluestem can be used as a component in longleaf pine habitat restoration. It is found in longleaf pine savannas and is identified as an important understory species in old growth longleaf pine stands (Grelen and Duvall 1966 and Varner et al. 2003). It is adapted to fire and is characteristic of the mid stages of plant succession (Tyrl et al. 2008).

Special Uses: Splitbeard bluestem is used as an ornamental in gardens and landscapes. In the fall, the stems turn to shades of blue, purple, and red. The silvery racemes are desirable for fresh and dried floral arrangements (Hoffman Nursery 2016).

Ethnobotany
The Houma Indians of Louisiana used Andropogon sp. to make a decoction taken by expectant mothers to strengthen them and their child (Speck 1941).

Status
**Threatened or Endangered:** No (US Fish and Wildlife Service 2016)

**Wetland Indicator:** Splitbeard bluestem is considered a facultative upland (FACU) plant in the continental United States (USDA, NRCS 2016)

**Weedy or Invasive:**
This plant may become weedy or invasive in some regions or habitats and may displace desirable vegetation if not properly managed. Please consult with your local NRCS Field Office, Cooperative Extension Service office, state natural resource, or state agriculture department regarding its status and use.

Please consult the PLANTS Web site (http://plants.usda.gov/) and your state’s Department of Natural Resources for this plant’s current status (e.g., threatened or endangered species, state noxious status, and wetland indicator values).

Planting Guidelines
Begin seedbed preparation well in advance of planting. Establish a weed free seedbed by tillage or herbicides. Prior to planting in the spring, the seedbed must be firmed and have accumulated soil moisture for improved establishment success.

Splitbeard bluestem seed is fluffy which makes it difficult to plant with a conventional grain drill. Native grass drills equipped with picker wheels or a fluffy seed box is the preferred method for planting splitbeard bluestem seed. When using a seed drill without picker wheels or a fluffy seed box, seed should be debearded to facilitate seed flow through the planter. Seed lubricants such as powdered graphite may also reduce bridging inside the seed box and drop tubes. Seed should be planted approximately 1/8 inch deep. Planting into a fluffy or loose seedbed may cause soil to sluff off into tracks left by the planter press wheels and bury the seed too deeply after the first rain event. It is better to plant shallow than too deep.

Splitbeard bluestem seed may also be broadcast planted but is not recommended. If seed is broadcast planted, a carrier agent such as sand or cat litter is required to help seed flow more easily through spreaders and for improved seed distribution. If possible, seed should be incorporated with a drag or cultipacker after broadcast planting. Seeding rates should be increased by 25% or more. Timing broadcast plantings to rain events will help incorporate seed into the soil and improve establishment. Spraying slurry mixtures through hydromulchers may also be more effective in certain situations such as steep slope seedings.

For calibration purposes, splitbeard bluestem contains approximately 216,000 seeds per bulk lb. A seeding rate of 6.0 PLS lb/acre (30 PLS seed/ ft²) is recommended. When planting seed mixes, adjust the seeding rate according to the percent of splitbeard bluestem in the mixture.

Management
Contact your local NRCS field office for assistance in developing a prescribed grazing plan. Do not graze splitbeard bluestem during the year of planting. Cattle readily graze splitbeard bluestem during the spring when foliage is tender but not when it is more mature. Since splitbeard bluestem is not an aggressive plant, it is seldom abundant enough to significantly contribute to cattle diet and be a key management species (Grelen and Hughes 1984). Proper grazing management of pinehill bluestem or little bluestem in the stand will also benefit splitbeard bluestem (Leithead et al. 1971). These warm season grasses are not tolerant of continuous or close grazing. To maintain stand health and production, only 50% of the current growth by weight should be harvested during a growing season. To control weeds, mow the stand at 8-10 inch stubble height or apply
herbicides labelled for grass. Splitbeard bluestem tolerates periodic controlled burning, however annual burning followed by grazing tends to eliminate it (Leithead et al. 1971).

**Pests and Potential Problems**
Possible pests of splitbeard bluestem include aphids, leaf spot, spider mites, spittlebugs, and rust. (Hoffman Nursery 2016)

**Environmental Concerns**
Splitbeard bluestem produces light, fluffy seeds that are wind distributed. Splitbeard bluestem is a native grass species and its escape from planted areas would not be considered hazardous or detrimental to the natural landscape.

**Control**
Splitbeard bluestem may be controlled by mechanical means such as mowing or by applying a broad spectrum herbicide which is labelled for control of grasses. Please contact your local agricultural extension specialist or county weed specialist to learn what works best in your area and how to use it safely. Always read label and safety instructions for each control method. Trade names and control measures appear in this document only to provide specific information. USDA NRCS does not guarantee or warranty the products and control methods named, and other products may be equally effective.

**Seeds and Plant Production**
Take a soil test of the planting site to determine fertility and pH. Amend field(s) based on soil test recommendations for lime, N, P, and K after the first growing season. This will minimize warm season weed competition during establishment.

Splitbeard bluestem will be most productive in fields that receive full sun to moderate shade or at least 3 hours of direct sunlight during the day. Seed production fields can be started by transplants or direct seeding. Transplanting is the fastest establishment method, reduces the time needed to achieve a solid stand, and allows for use of pre-emergent herbicides. Seed can usually be harvested in the first year. Direct seed splitbeard bluestem in the spring with a native grass drill. Use a seeding rate of 6 PLS lb/ac and plant approximately 1/8 inch deep.

Splitbeard bluestem is indeterminate and begins to flower in late August. Seed matures from October to December and can be harvested using a flail harvester or combine. The flail harvester is a nondestructive harvest method allowing multiple harvests of seed production fields. This machine harvests mature seed, leaving the immature seed for a later harvest. When harvesting with a combine, use low volume air settings to minimize seed loss. After harvest, the seed should be dried and debearded to partially remove awns and other seed appendages before cleaning. A seed cleaner with air adjustments and separation screens is used to remove stems, chaff, and unfilled seed. To enhance seed longevity, store seed in a humidity and temperature controlled environment.

**Cultivars, Improved, and Selected Materials (and area of origin)**
Currently splitbeard bluestem ecotypes are commercially available. Purchase splitbeard bluestem seed based on the local climate, resistance to local pests, and intended use. Consult with your local land grant university, local extension or local USDA NRCS office for recommendations on adapted materials for use in your area.

The U.S. Department of Agriculture (USDA) prohibits discrimination against its customers, employees, and applicants for employment on the bases of race, color, national origin, age, disability, sex, gender identity, religion, reprisal, and where applicable, political beliefs, marital status, familial or parental status, sexual orientation, or all or part of an individual's income is derived from any public assistance program, or protected genetic information in employment or in any program or activity conducted or funded by the Department. (Not all prohibited bases will apply to all programs and/or employment activities.)

If you wish to file an employment complaint, you must contact your agency's EEO Counselor (PDF) within 45 days of the date of the alleged discriminatory act, event, or in the case of a personnel action. Additional information can be found online at [http://www.ascr.usda.gov/complaint_filing_file.html](http://www.ascr.usda.gov/complaint_filing_file.html).
If you wish to file a Civil Rights program complaint of discrimination, complete the USDA Program Discrimination Complaint Form (PDF), found online at http://www.ascr.usda.gov/complaint_filing_cust.html, or at any USDA office, or call (866) 632-9992 to request the form. You may also write a letter containing all of the information requested in the form. Send your completed complaint form or letter to us by mail at U.S. Department of Agriculture, Director, Office of Adjudication, 1400 Independence Avenue, S.W., Washington, D.C. 20250-9410, by fax (202) 690-7442 or email at program.intake@usda.gov. Individuals who are deaf, hard of hearing or have speech disabilities and you wish to file either an EEO or program complaint please contact USDA through the Federal Relay Service at (800) 877-8339 or (800) 845-6136 (in Spanish).

Persons with disabilities who wish to file a program complaint, please see information above on how to contact us by mail directly or by email. If you require alternative means of communication for program information (e.g., Braille, large print, audiotape, etc.) please contact USDA's TARGET Center at (202) 720-2600 (voice and TDD).

For any other information dealing with Supplemental Nutrition Assistance Program (SNAP) issues, persons should either contact the USDA SNAP Hotline Number at (800) 221-5689, which is also in Spanish or call the State Information/Hotline Numbers. For any other information not pertaining to civil rights, please refer to the listing of the USDA Agencies and Offices for specific agency information.
